

SCUTTLE APPLICATIONS GUIDE

Last Revised 2020.10.16

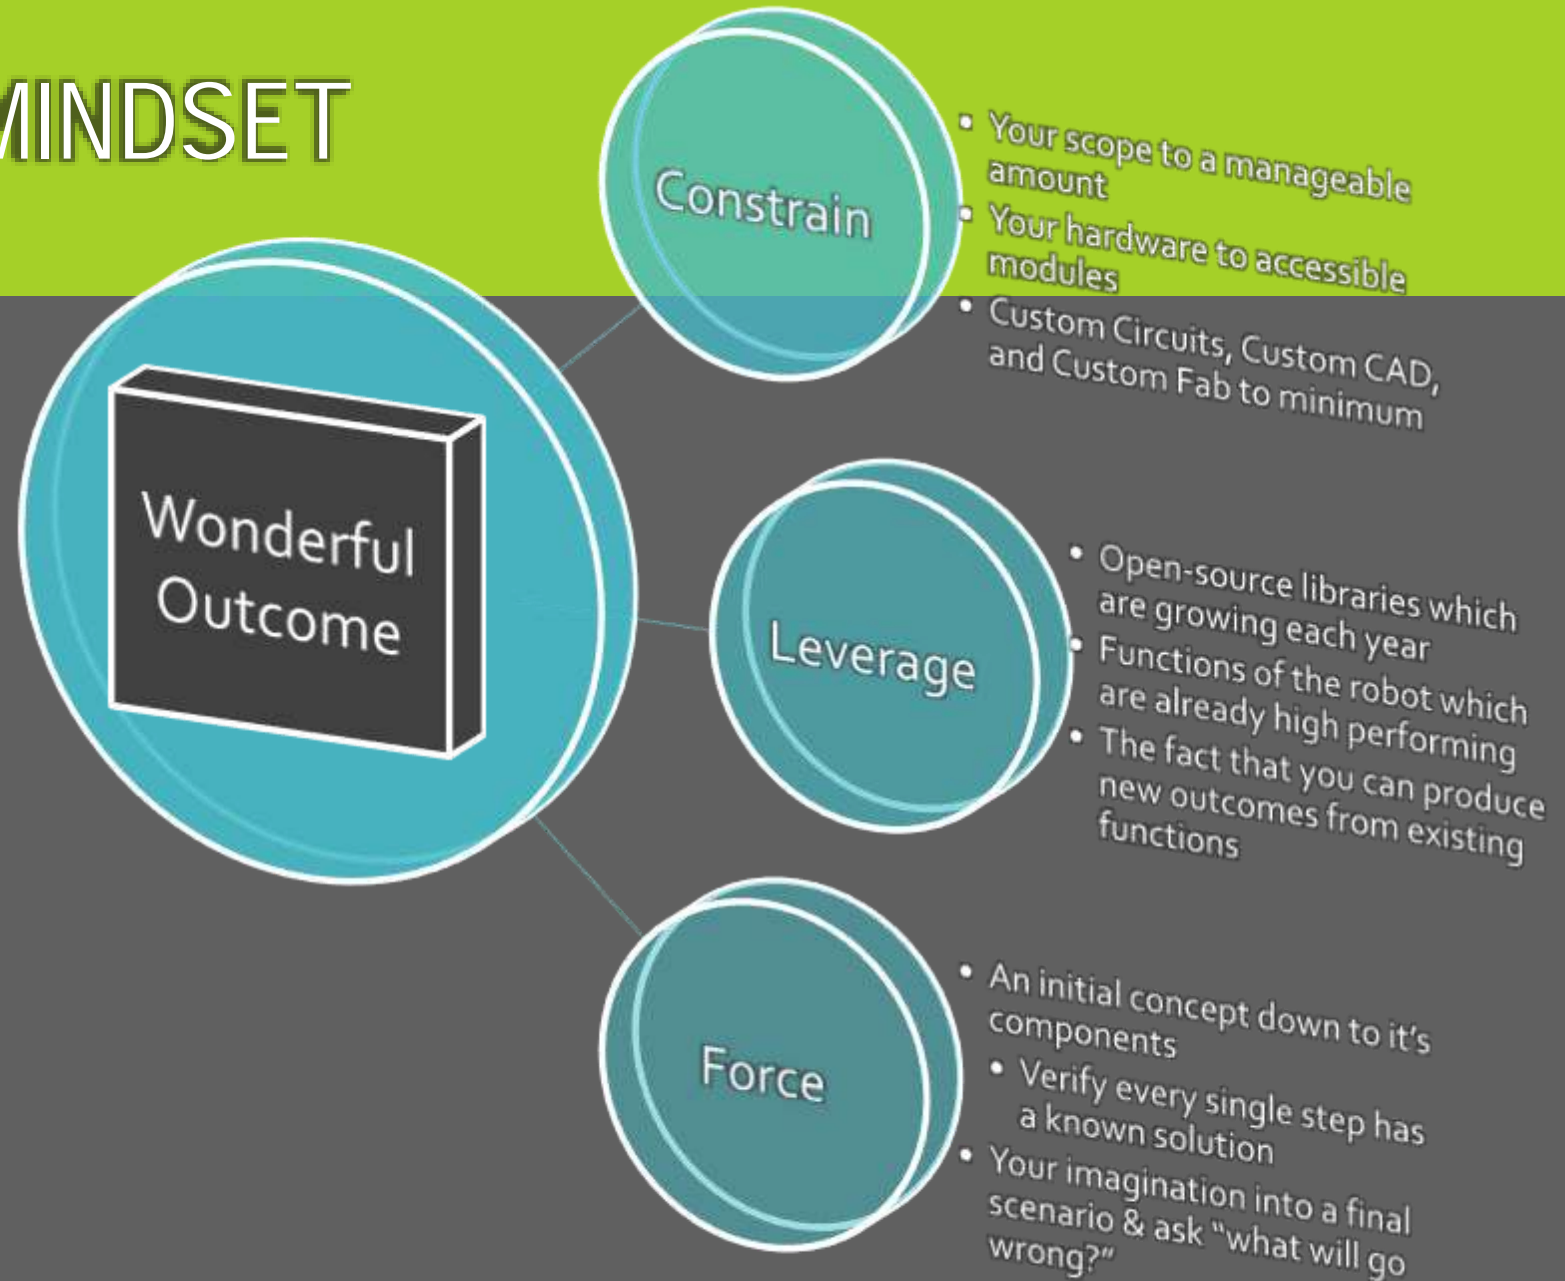

Ever-growing list of easy-to-approach project ideas.

Submit your ideas to scuttleProject@gmail.com

IDEATION MINDSET

Project ideation is not just a matter of creativity, it's a serious challenge in problem-solving and **STRUCTURED** brainstorming.

This skill takes years to develop. Here are some ideation guidelines that often make or break a final project demo.

Applications Guide
SECTION 1

PROJECT TOPICS: HARDWARE BASED

Projects that require additional actuators

Feasible scope for MVP in less than 6 months

Limited to 1 or 2 actuators

Only actuators & sensors which have open-source libraries already

1.1 ENVIRONMENTAL SAMPLING (GREENHOUSE)

Task: Environmental measuring –
Identify containers and probe for
temp/moisture/pH

Why it is feasible:
Probes and their associated drivers
can easily fit on a scuttle and within
power budget. Probing for
parameters does not require fine
precision of movement so students
can achieve this with basic software
and materials.

Raft bed hydroponics nursery:
These seedlings will benefit from
monitoring of coloration and
impacts from pests, or nutrient
deficiencies.

1.2 SECURITY ROUTINE

Task: Security tasks – take photos of designated items & upload.

Why it is feasible:
Camera and RFID technologies have already been tested on SCUTTLE with available examples.

1.3 3D PRINTER FILAMENT HANDLING

Task: Gather, transport, and load 3d filament spool onto hangers

Why it's feasible:

Spools are standardized and found in most makerspaces. Low cost actuators don't require additional power supply and have capability to lift or manipulate objects the size of spools.

+

1.4 MOBILE REFRESHMENTS

Task: Dispense purified water into cups where people need water.

Why it is feasible: SCUTTLE has already shown ability to carry a full size water jug and more. 12v pumps are readily available and powerful enough to lift water at a reasonable rate.

1.5 RESTAURANT TABLE DELIVERY

Task: Carry trays of food or supplies to designated location.

scuttleProject@gmail.com

1.6 INVENTORY LABELING

Task: Add a portable label printer, identify boxes and label them with the proper information for shipping or contents

Example actuator:

- <https://www.searchingc.com.my/products/printer>

M-brush on amazon:
<https://www.amazon.co.uk/Bluetooth-Printer-Portable-Cicarica-Anywhere/dp/Bo85VCRVS2>

Youtube example: <https://youtu.be/7Psmlwmv1fc>

1.7 COLLECT TENNIS BALLS

- Cruise around the court
- Detect balls by color & shape
- Collect them in a basket
- Bring to a designated spot & dump

1.8 PET STORE MONITORING

- Look after the pet store on holidays to give alerts
 - For Dogs: detect barking in kennels
 - For Fish: detect dead fish, or sample water
 - pH
 - Temp
 - Salinity
 - Etc
 - For birds, reptiles, etc
 - Customize programs for irregular behavior
 - Sounds
 - Violent motion (movement rate)
 - Lack of motion or escape

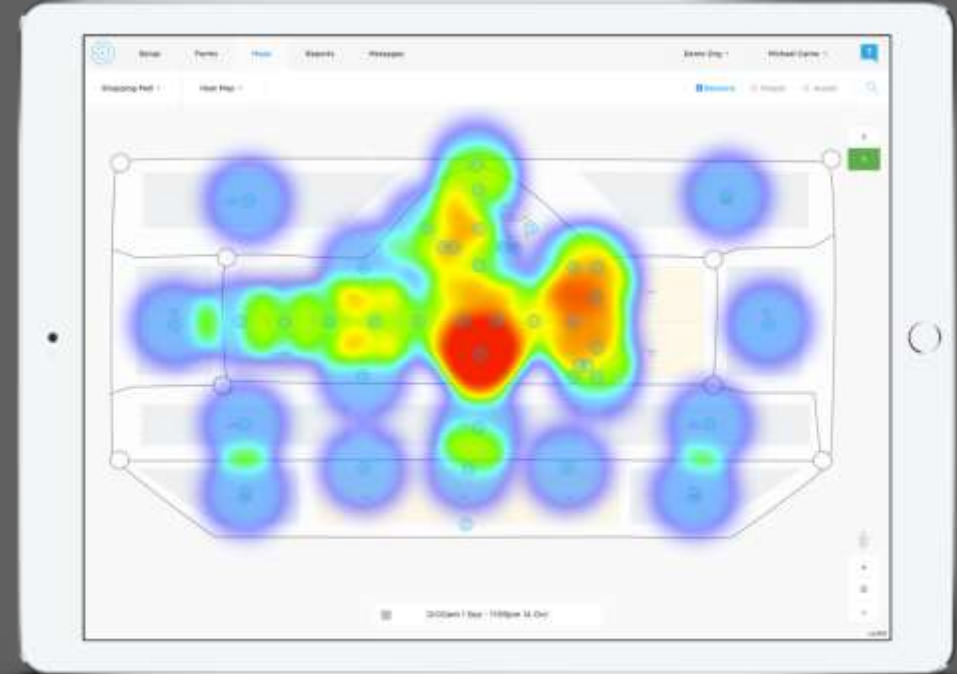

1.9 HAZARD REPORTING

- Detect hazards to humans in the pathway
 - Cracks in the sidewalk
 - Debris
- Take a photo onsite to show the condition
- Send the photo right away by cell carrier
- Use GPS coordinates to send a report with photograph to the department who will make a repair or send a technician out for inspection.

1.10 THERMAL FACILITY AUDIT

- Make a map of a building and take temperature measurements throughout
- Detect Windows & sources of airflow
- Use an air vane to detect airflow direction
- Generate a report on the indoor climate & areas of concern for heat buildup (cooling) and heat loss (heating)

1.11 FIRE FIGHTING BOT

- Simple 2DOF arm for aiming a nozzle.
- Payload: secure 1 or more fire extinguishers
- Optional: use thermal imaging to detect fires.

Point Aim Spray Sweep (PASS)

1.12 CAMPUS SECURITY ESCORT

- Universities have already identified a need for security during times when someone is alone or in need of help.
- A mobile security device is just an enhancement over fixed security call boxes.
- Budgets have already been allocated on this kind of infrastructure for many institutions.
- SCUTTLE can be equipped with emergency call functions, pathway lights for added safety or an extremely loud siren at the press of a button.
 - Reliable 4G cellular modules are available off-the shelf to give redundant connectivity when wifi may be interrupted.

Applications Guide
SECTION 2

PROJECT TOPICS: SOFTWARE BASED

Projects that do not require additional actuators

2.1 ENVIRONMENTAL MAP MAKER

- Use only the onboard navigation sensors (LIDAR and SONAR)
- Create a map of a room using LIDAR. Implement a remote-control driving and send a command to switch to automatic mode for exploring the room.

2.2 VISUAL TARGET DISCOVERY

Locate a visual target using machine vision. Collect data about the location of that object and report the data wirelessly.

2.3 RFID & SENSOR PAIRING

Scan multiple RFID tags and report environmental readings to the IOT for each location.

2.4 PAYLOAD IOT WEIGHING SYSTEM

Locate the weight scale, measure the mass of the robot and exchange data with the scale as necessary to report the robot weight to the IOT

+

2.5 PARKING ENFORCEMENT

Parking enforcement such as “1-hour parking” is always a gamble because the checking routine is rarely standard.

It’s bad for guests who need to gamble if they have an extra 5 minutes and it’s bad for enforcers who struggle to keep fairness when they check spots

With no additional hardware, scuttle can be programmed to monitor important parking spots and indicate the status of all spots via web.

During Emergencies, SCUTTLE could even notify officials of empty spots when there is construction or obstructions in fire lanes, etc. This added value can offset the cost of adding robotics to small parking areas where scuttle must lap every 15 minutes or so.

Applications Guide
SECTION 3

PROJECT TOPICS: FEATURE BASED

These projects add a feature, instead of a full behavior routine

3.1 COMPREHENSIVE TELEMETRY (SELF)

- Design a data structure to hold all major parameters of scuttles
- Design a data structure to carry these parameters for multiple scuttles in a fleet.
- Create a modular NodeRed dashboard with drag-and-drop functionality for new teams to gain awareness of their critical parameters while testing other tasks.

3.2 HOLOGRAPHIC DISPLAY

- Mount and integrate a hologram LED wand.
- Use the wand to display important metrics to users.

3.3 BATTERY CHARGING SYSTEM

- Option A: Wireless Charging
 - Create a station which is child-safe by adding wireless charging to a dock where SCUTTLE navigates to receive a recharge.
- Option B: Battery changeout station
 - Add more automation to the station itself and allow SCUTTLE's battery to be removed and subsequently replaced.
 - Design a modified battery pack which lends itself to quick recharge.

3.4 SOLAR CHARGING SYSTEM

- Operating as low as 7 watts, the SCUTTLE is a candidate for 100% solar sustainability.
- Make SCUTTLE a long-term outdoor rover by designing a system to recharge the batteries by day and to “sleep” at night.
- If the solar module capacity is increased, it is possible to drive 24 hours per day while charging only for 10

10 Watt Solar Panel
only \$11.50 USD as
of 2020 October
